

FORAN HIGH SCHOOL ATHLETIC FIELDS

Milford, CT

Agresoil Compost™ made in Fairfield, Connecticut, was used to amend soils for athletic fields located at the Foran High School in Milford, CT. Compost was shipped directly to the job site where it was mixed with sand and on-site soil to prepare a root zone mix for the new fields.

The compost (used at about 20% by volume) was used to increase soil organic matter and provide nutrients. Fairfield compost is an ideal amendment for construction of athletic fields. Because of the “woody texture,” the compost adds organic matter while maintaining the necessary hydraulic conductivity for good drainage.

The project was performed by CJ Fucci Contractors in accordance with the design specifications prepared by Westcott & Mapes Architects.
